j Patent No. 6319716

i GENERAL INFORMATION

APPLICANT: TIKOO, SUREH K.

APPLICANT: ARBINK, LORNE A.

TITLE OF INVENTION: EQUINE A.

TITLE OF INVENTION: BOVINE ADENOVIRUS GENOME AND THEIR USE IN VACCINES

TITLE OF INVENTION: BOVINE ADENOVIRUS GENOME AND THEIR USE IN VACCINES

TITLE OF INVENTION: BOVINE ADENOVIRUS GENOME AND THEIR USE IN VACCINES

CURRENT APPLICATION NUMBER: US/9/103,330A

CURRENT FILING DATE: 1998-06-23

EARLIER PELING DATE: 1997-06-23

EARLIER APPLICATION NUMBER: 08/164,292

EARLIER APPLICATION NUMBER: 08/164,292

MUMBER OF SEQ ID NOS: 40

Sequence 48, Application US/09262537

Patent No. 6479256

GENERAL INFORMATION:

APPLICANT: Hayflick, Joel

TILLE OF INVENTION: Lectomedin Materials and Methods

FILE REFERENCE: 77866/35307

CURRENT APPLICATION NUMBER: US/09/262,537

CURRENT FILING DATE: 1999-03-04

EARLIER PILING DATE: 1998-03-04

MUNBER OF SEQ ID NOS: 64

SOFTWARE: Patentin Ver. 2.0

strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the Oligo-df track served to identify it as a clone from the normalized corpus-striatum library cDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through Research Genetics (www.resgen.com)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Library was constructed by Corina Guder / GATC Konstanz, Germany

Easi, 19, 35, 359, 369.

The sequence contained an oligo-dT track that was present in the oligouchectic that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized medulla library cDNA Library Preparation. M.B. Soares Lab Clone distribution: clones will be available through Research POLYA-Yes.

The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to verify it as a clone from the normalized distal colon library cDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through Seg primer: M3 Forward

POLYA=Yes.
                                                                                                                                                                              Rattus norvegicus (Norway rat)

/Mol type="mRNA"
// And type="mriticum and leaf; Vector: pCMV.SPORT6;
// Conditions for growth: Seeds were germinated in a water-saturated mix (50% black earth and 50% ProMix) in a growth chamber for 7 days under an irradiance of 200 mmol m-2 sec-1. The temperature was maintained at 20 degrees C with a 15-hr photoperiod under a relative humidity of 70%. After this period watering of plants was stopped. Four time points were sampled during a two week period; the first after willing was observed and the last, two weeks later, consisted of live crown and leaf tissue (leaf tissue that was yellow was not included in sampled material). First strand synthesis in this library was done in the presence of methylated dCTP thereby protecting from internal cleavage with Not!."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Email: fgas_ests@cs.usask.ca
This sequence is the direct result of the Base calling software
Phred (default parameters). It is the raw base calls. To aid in the
identification of the high quality insert the software Lucy
(default parameters) has been run on this sequence. Lucy identified
the region [37,799].

The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized bladder library cDNA library Preparation: M.B. Soarcs Lab Clone distribution: clones will be available through Research

polylinker; Site 1: Not 1; Site 2: Eco RI; The UI-R-CNO
library is a normalized library constructed from the
following tissues: brown adipose, penis, salivary glands,
bladder, fundus, cervix, seminal vesicles. For a detailed
description of the library from which this clone was
derived, please visit our web site at
ratest.eng.iuwa.edu. The subtraction has been previously
described in (Bonaldo, Lennon and Soares, Genome Research

Reverse transcription of tissue mRNA and CDNA amplification were performed under low stringency conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CR477607 CR477607 Rat pBluescript Lion Rattus norvegicus cDNA clone LIOND463H12407 3', mRNA sequence.

polylinker; Site 1: Not I; Site 2: Eco RI; The UI-R-Y0
library is a subtracted library derived from an
individually-tagged normalized whole-eye (minus the lens)
library. The driver for the subtraction consisted of a
pool of all previous libraries (UI-R-A) (UI-R-E0,
UI-R-E1, UI-R-C0, and UI-R-C1). The tag is a string of
3-5 nucleotides present between the Not I site and the
oligo-dT track which allows identification of the library
of origin of a clone within the mixture. The subtracted
library (UI-R-Y0) was constructed as follows: PCR
amplified cDNA inserts from previous library of ones from
which 3' ESTS had been derived whole-eye library in
the form of single-stranded circles (subtracted library) was purified
by hydroxyapatite column chromatography, converted to
double-stranded circles and electroporated into DH10B
bacteria (Life Technologies) to generate the UI-R-Y0
library. This procedure has been previously described
lBonaldo, Lennon and Soares, Genome Research 6: 791-806,

Rubin BY, Anderson SL, (RUBI/) RUBIN B Y. (ANDE/) ANDERSON S L.

WPI; 2002-601228/65.

Detecting a polymorphism in a gene encoding the lkappaB kinase-complex-associated protein is used to diagnose and identify carriers of familial dysautonomia.

Claim 7; Page 9; 16pp; English.

(GEHO) GEN HOSPITAL CORP.

```
The invention provides a method for detecting a polymorphism linked to a gene associated with familial dysautonomia (FD). This involves detecting a disruptive mutation in a gene encoding the itsapea kinase-complex.

associated protein (IKAP) on chromosomes with the major FD haplotype, a IKAP-encoding gene showed, in chromosomes with the major FD haplotype, a Tto C transliton in position of the donor splice site of infron 20.

This mutation (2507+6T to C) results in the generation of an IKAP mRNA in which exon 20 is spliced out along with intron 20. Sequence analysis of the IKAP gene of individuals heteroxygous for the FD chromosome with the most common maior haplotype (minor 2) showed a G to C transversion of nucleotide 2390 in exon 19 of the reported IKAP CDNA, resulting in an Arg586pro aminor able substitution and disruption of a consensus Ser/Thr kinase phosphorylation site. The present sequence is a primer that can be used in a claimed method for detecting a disruptive mutation in the IKAP gene, using single-errand conformational polymorphism (SSCP) analysis.

The primer was used in the genotype analysis of FD alleles. Use with the probands homozygous for the major haplotype, all affected individuals were homoallelic for 2507+6C to C and all the parents were hereoxygous for the major haplotype, and minor 2 FD cother parent and the proband were heteroxygous for E07+6T to C. Individuals with probands where Proband were heteroxygous for the major FD haplotype showed that 100% of the probands were homozygous for the major FD haplotype showed that 100% of the probands were homozygous for the major FD haplotype showed that 100% of the probands were homozygous for the major and the Probands were heroxygous for the major for date for S07+6T to C mutation, and the probands were homozygous for the FD haplotype and the 2507+6T to C mutation of the presence of 25 carriers of 2507+6T to C and 2 individuals with the presence of 25 carriers (2507+6T to C and 2 individuals with the presence of 25 carriers (2507+6T to C and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; IXBKAP; Familial Dysautonomia; FD; Riley-Day syndrome; Hereditary Sensory and Autonomic Neuropathy Type III; carrier screening; FD2; mutation; gene; chromosome 9q31; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

The present invention relates to methods and compositions useful for detecting mutations which cause Familial Dysautonomia (FD, Riley-Day Syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIN 223900]. It was found that mutations in the IKBKAP gene (see AB080565) are associated with FD. The mutation associated with the major haplotype of FD, FDI mutation, is a base pair (bp) mutation, where the thymine nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced with a cytosine. This results in skipping of exon 20 in the mRNA from FD patients, although they continue to express varying levels of wild-type continue to express varying levels of wild-type of patients, although they continue to express varying levels of wild-type or nucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine. This bp mutation, is a bp mutation, where the guanine or nucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine. This bp mutation site. The IKBKAP nucleic acid sequences are useful for identifying a subject with FD and for rapid carrier screening. The IKBKAP gene contains 37 exons and maps to chromsome 9931. Note: the present sequence was not shown in the specification, but was derived from the human wild-type IKBRAP sequence given in Fig 6
                                                                 New IKBKAP genes with mutations, useful for identifying a subject with familial dysautonomia (FD), or for rapid carrier screening in the Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or prenatal diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; IKBKAP; Familial Dysautonomia; FD; Riley-Day syndrome;

The present invention relates to methods and compositions useful for detecting mutations which cause Familial Dysautonomia (FD, Riley-Day Syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIN 223900]. It was found that mutations in the IKBKAP gene (See ABQ80565) are associated with FD. The mutation associated with the major haplotype of FD. FDI mutation, is a base pair (bp) mutation, where the thymine or nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced with a cytosine. This results in Ribping of exon 20 in the mRNA from FD patients, although they continue to express varying levels of wild-type continue to profine missense mutation (R696P) in the IKBKAP protein, is a bp mutation, where the guanine contains are subject with FD and for rapid carrier screening to phosphorylation site. The IKBKAP mucleic acid sequences are useful for in the IKBKAP protein, which is predicted to disrupt a potential contains 37 exons and maps to chromosome 9931. Note: the present sequence was not shown in the Specification, but was derived from the chuman wild-type IKBKAP sequence given in F19 6 thuman wild-type IKBKAP sequence given in F19 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                 New IXBKAP genes with mutations, useful for identifying a subject with familial dysauconomia (FD), or for rapid carrier screening in the Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or prenatal diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, IKBKAP; Familial Dysautonomia; FD; Riley-Day syndrome;

The present invention relates to methods and compositions useful for detecting mutations which cause Familial Dysautonomia (FD, Riley-Day Syndory and Autonomic Neuropathy Type III) [OMIM Syndorme, Hereditary Sensory and Autonomic Neuropathy Type III] [OMIM Carles associated with FD. The mutations in the IKERAP gene (see AB2080565) are associated with FD. The mutation associated with the major haplotype of FD. FDI mutation, is a base pair (bp) mutation, where the thymine nucleotide located at bp 6 of intron 20 in the IKERAP gene is replaced with a cytosine. This results in skipping of exon 20 in the mRNA from FD patients, although they continue to express varying levels of wild-type message in a tissue-specific manner. The mutation associated with the minor haplotype, FD2 mutation, is a bp mutation associated with a cytosine. In this bp mutation causes an arginine to proline missense mutation (Re96P) in the IKERAP procesin, which is predicted to disrupt a potential phosphorylation site. The IKERAP nucleic acid sequences are useful for identifying a subject with FD and for rapid carrier screening. The IKERAP gene contains 37 exons and maps to chromosome 9931. Note: the present sequence, was not shown in the specification, but was derived from the
                                                                                                                 New IXBKAP genes with mutations, useful for identifying a subject with familial dysautonomia (FD), or for rapid carrier screening in the Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or prenatal diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, IXBKAP; Familial Dysautonomia; FD; Riley-Day syndrome;

The present invention relates to methods and compositions useful for detecting mutations which cause Familial Dysautonomia (PD. Riley-Day Syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIM 223900]. It was found that mutations in the IKBKAP gene (the present sequence) are associated with FD. The mutation associated with the major haplotype of FD, FDI mutation, is a base pair (bp) mutation, where the thymine nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced with a cytosine. This results in skipping of exon 20 in the mRNA from FD patients, although they continue to express varying levels of with the minor haplotype, FDZ mutation, is a bp mutation associated with the minor haplotype, FDZ mutation, is a bp mutation, where the cytosine. This bp mutation causes an arginine to proline missense mutation (R696P) in the IKBKAP protein, which is predicted to disrupt a cytosine. The prosphorylation site. The IKBKAP is predicted acid sequences are useful for identifying a subject with FD and for rapid carrier screening. The IKBKAP gene contains 37 exons and maps to chromosome 9431
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

             New IKBKAP genes with mutations, useful for identifying a subject with familial dysautonomia (FD), or for rapid carrier screening in the Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or prenatal diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; immune; haematopoietic; immune/haematopoietic antigen; cancer; cytostatic; gene therapy; vaccine; metastasis; ds.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

Disclosure; SEQ ID NO 24669; 3071pp + Sequence Listing; English.

AAKS4951 to AAK64702 encode the human immune/haematopoietic antigen (I) anino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased example, they may be used to treat disorders associated with decreased that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) supplement the patients own conduction of (I). Additionally, (I) mucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially

The invention relates to an isolated polynuclectide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences that hybridize to (a), under moderately stringent conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP68596-ABP68637) encoded by (I) and oligonucleotide can be used to detect cancer in a patient and compositions comprising polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antipgen presenting cells expressing the polypeptide are useful in treating pancreatic cancer probes or primers for nucleic acid hybridisation, in the design and probes or primers for nucleic acid hybridisation, in the design and preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in the tumour cells, in vaccines and for gene
                               to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide and pancreatic tumor polypeptides, useful for diagnosing, preventing and/or treating cancer, particularly pancreatic
   cancers and cancer metastases of haematopoietic-derived cells. AAK64703
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; pancreas; cancer; gene therapy; vaccine; immunostimulant; cytostatic; tumour; gene; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynuclectide sequence is a full length human cDNA clone of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonuclectide primers (830 cDNAs) useful for synthesizing full length human cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ota T, Nishikawa T, Isogai T, Hayashi K, Ishii S, Kawai Y;

This invention describes novel nucleic acid (cDNA) sequences (A) which have anticancer activity and are highly expressed in ovarian tumor tissue can describe and breast cancer tissue). The products of the invention can be used for gene therapy. (A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of ovarian cancer; (ii) directly for treating this form of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTS from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. AAZ77450-Z77572 represent the human ovarian tumor cDNA and analysis of the method of the invention and analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid sequences expressed in ovarian, and some other, cancer tissues, and derived polypeptides, for treatment of ovarian cancer and identification of therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, ollowers, and for chomosome and gene mapping, and in recombinant production of (II). (II) the polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cartivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations companied to genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coching sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and to produce other types of data and products dependent on DNA amino acid sequences. Horrigan S; Endress G, Carter KC, Ebner R, Augustus M, Weaver Z; Young PE, A Soppet DR,

The present invention describes a method (M1) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 5\$ identical to (S), where a change in cartivity and can be used in gene therapy. MI can be used for screening an activity and can be used for producting a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such properties of the agent. MI can be used in the treatment of cancer such properties of the agent, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, catchona, clear cell cancer, infiltrating lobular cancer, squamous Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set. Claim 1; SEQ ID NO 229; 44pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to PRO proteins and their coding sequences. The PRO proteins are useful for diagnosing and treating a B cell related disorder, e.g. X-linked infantile hypogammaglobulinemia, polysaccharide antigen unresponsiveness, selective IgA deficiency, selective IgM deficiency, selective deficiency of IgG subclasses, immunodeficiency with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New PRO polypeptide, useful for diagnosing and treating a B cell related disorder, e.g. Burkitt's lymphoma, rheumatoid arthritis, autoimmune mediated hemolytic anemia, myasthenia gravis or ankylosing spondylltis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunosuppressive, Cytostatic, Antiarthritic, Antirheumatic, Antianemic, Antialegic, Muscular, Neuroprotective, Nephrotropic, Antiinflammatory, Gene Therapy, PRO, B cell related disorder, cancer, immunatory, end matery disease, human, gene; ss.

Implement intermediate franchisms, follicular lymphoms, type II hypersensitivity, rheumatoid arthritis, autoimmune mediated haemolytic anaemia, mysathenia gravis, hypodrenocorticism, glomerulonephritis, or ankylosing spondylitis. The PRO proteins are also useful for preparing a medicament for treating a condition that is responsive to the PRO protein, e.g. cancer or immune-mediated inflammatory diseases. The PRO coding sequences are useful as hybridization probes in chromosome and gene mapping, in preparing PRO proteins, or in generating transgenic animals or knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inhibiting proliferation of a hematopoietic cell, useful for treating or preventing leukemia, comprises modulating the level or activity of nor-1 and/or nur77 nuclear receptor.

The present sequence is that of pig nor-1 nuclear receptor nucleic acid A0011/67. Nor-1 has been identified as a molecular target for therapeutic intervention in the treatment of myeloid leukaemia. The invention provides methods of inhibiting the proliferation of a haematopoletic stem cell or a haematopoletic myeloid cell by modulating the level of a nor-1 and/or nur77 nuclear receptor. This involves increasing the level of the receptor polypeptide or polynucleotide, e.g. by administration of a receptor polypeptide or polynucleotide. A claimed method of treating leukaemia comprises modulating a nor-1 and/or nur77 nuclear receptor in a haematopoletic stem cell or myeloid cell. Also claimed are methods of identifying an upregulator of expression of nor-1 and/or nur77, of identifying a compound for the treatment of leukaemia, and of screening for a compound for treatment of leukaemia, and of screening for a compound for treatment of leukaemia, and a mouse model for

sequences can be used for determining the presence of or predisposition of to, or preventing or treating pathological conditions associated with an offer-associated disorder. The nucleic caids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graff ve host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), ADBS, virial, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAX35694-X35747 represent cDNA sequences that encode novel polypeptides (AAY02358-84) which are identified from a human placental cDNA library by the signal sequence trap (SST) method. The polypeptides have a broad range of physiological activity, including immunisation against and inhibition of infections, allergies and cancer; regulation of tissue formation and repair; activin/inhibin activity; chemokine/cytokine activity; blood coagulation regulation; and receptor/ligand agonist or antagonist activity. The polypeptides can be used for prevention and treatment of disorders including infections by bacteria, yeasts and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Signal sequence trap method; SST method; immunisation; inhibition; infection; allergy; cancer; regulation; tissue formation; tissue repair; activin activity; inhibin activity; chemokine activity; cytokine activity; blood coagulation regulation; agonist; antagonist; metabolic disorder; hormonal disorder; immune disorder; severe combined immunodeficiency; SCID; AIDS; thrombosis; cancer; wound;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polypeptides identified by the signal sequence trap method from a human cDNA library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cDNA encoding a protein identified by the signal sequence trap method

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAX35694-X35747 represent cDNA sequences that encode novel polypeptides (AAY02358-84) which are identified from a human placental CDNA library by the signal sequence trap (SST) method. The polypeptides have a broad range of physiological activity, including immunisation against and inhibition of infections, allergies and cancer; regulation of tissue formation and repair; activin/inhibin activity; hond coagulation regulation; and receptor/ligand agonist activity. Phood coagulation regulation, and receptor/ligand agonist antagonist activity. The polypeptides can be used for prevention and treatment of disorders including infections by bacteria, yeasts and viruses (including HIV) and protozoa metabolic and hormonal disorders; immune disorders (including severe combined immunodeficiency (SCID) and AIDS; thrombosis; cancer; and traumatic or surgical wounds
                                                                                                                                            o,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to the sequences of several cDNAs that are differentially expressed in activated T cells. The sequences of the invention may have antiallergic, cytostatic, immunosuppressive and antimicrobial activity and may be used in gene therapy. The invention also comprises a method for screening samples for differentially expressed genes and a method for detecting these cDNAs by hybridisation. The methods and compositions of the present invention are useful for diagnosing, treating, staging or monitoring treatment for allergy, disorders. The present sequence represents a cDNA of the invention that is differentially expressed in activated T cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 5642 BP; 1472 A; 1399 C; 1212 G; 1465 T; 0 U; 94 Other;

```
The invention relates to isolated polymucleotide (1) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRN) primers, oligomers, and for chomosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food suppertied in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on but and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            amino acid sequences. The invention relates to a combination comprising several polynucleotides having any one of 127 sequences (51) such as the sequence of human cal and the complements. The complements of the complements of the confidence of human cal mana mana cal and their complements. The confidence of human cal in LDS (lipopolysaccharide)-treated foam cells. Also included are containing an extended or full length game from a library of nucleic acid sequences, an extended or full length game from a library of nucleic acid sequences, an extended or full length game from a library of nucleic acid containing the vector, a purified polypeptide appearing as ADE25750 and containing the vector, a purified polypeptide appearing as ADE25750 and composition comprising a protein by culturing the host cell, and a composition comprising a protein by culturing the host cell, and a composition comprising a protein by culturing the host cell, and a composition comprision of differential expression of one or more throughout detection of differential expression of one or more or more compounds to compounds in a sample. The sample is from a subject with a theory compounds to identify a ligand which binds a polynucleotide. The library is chosen from bind molecules, peptides, proteins and RNA molecules or compounds to identify at least one ligand which specifically binds a compounds to identify at least one ligand which specifically binds a compounds to identify at least one ligand which specifically binds a compounds to identify at least one ligand which specifically binds a compound compound to a sample for making a antibody. The foam cell-expressed nucleic acids are useful cardiovascular disorder. The foam cell-expressed nucleic acids are useful cardiovascular disorder. The foam cell-expressed nucleic acids are useful cardiovascular disorder. The foam cell-expressed nucleic acids are useful cardiovascular disorder. The foam cell-expressed nucleic acids are useful cardiovascular disorder. The foam cell-expressed nucleic acids are useful cardiovas
                                                                                                             Human; ss; differential expression; foam cell; LPS; lipopolysaccharide; cardiovascular disease; atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Combination containing several polynucleotide that are differentially expressed in foam cells and complements of the polynucleotides, useful for diagnosing cardiovascular disease or atherosclerosis.
                                                                        Human cDNA differentially expressed in foam cells #105.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Kaser MR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1; SEQ ID NO 105; 37pp; English.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in the product of the traits to assess biodiversity and the product of the traits to assess biodiversity and the product of the product of the partners of the product of the product
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fit, wipo.int/pub/published_pct_sequences
